

Why Partner with PDO Max?

When it comes to PDO threads training and supply, PDO Max is the ideal partner.

FDA Cleared

Plenty of companies will say that their PDO threads have been cleared by the U.S. FDA and they might be telling the truth. But PDO Max is not only cleared for PDO threads, we are also one of the very few companies that have FDA clearance for PDO threads pre-loaded into a cannula. And as your trusted PDO thread distributor in cannula, we provide thread training and consultation to help boost your business.

Extensive Training Courses

Facial aestheticians and clinicians who want to perfect the technique of PDO thread lifting can receive the training they need with us. Here at PDO Max, we offer extensive in-house training workshops where you can work on up to four patients with different treatment needs. You will receive over \$6,000 worth of training threads so you can be fully comfortable and perfectly capable performing PDO thread lifting procedures on your own when you leave.

Zero Failure Rate

Different patients have different needs, which is why there are various types of PDO threads. The most popular might be the barbed PDO threads, which are known for their ability to stimulate collagen synthesis. At PDO Max, our barbed threads are cut in a way that provides significant support to your patient's skin with zero failure rate.

Quality Threads

Not all PDO threads are created equal. Our FDA-recognized PDO threads are manufactured in South Korea, a country that has one of the best beauty and wellness industries. We developed the specification of these threads, which means they are manufactured just for us. Unlike other companies, we do not simply import another brand's product line.

Frequently Asked Questions

What are PDO threads?

Polydioxanone (PDO) threads are thinner-than-hair medical grade absorbable threads that lift and tighten sagging skin tissues. These threads are implanted into the subcutaneous layer of the skin using small needles or cannulas. Once the threads are inserted, the skin looks filled and lifted instead of droopy.

How does PDO thread lift work?

A PDO thread lift is a minimally invasive procedure that helps tighten a person's skin. Without the need for big incisions, unlike most facelift procedures, PDO thread lifting uses small needles to insert fine threads under the skin. These PDO threads are especially designed to anchor the sagging skin and lift it upwards. The threads also stimulate collagen production, which further diminishes the appearance of fine lines and wrinkles.

Who gets PDO thread lifts?

Anyone who is looking to correct lines, wrinkles, and other manifestations of aging in the face can be a good candidate for a PDO thread lift procedure. If a person's sagging skin is under the chin and near the cheeks, the procedure is especially effective and beneficial for them.

How long does it take to recover from the procedure?

Since PDO thread lift is a minimally invasive procedure, the recovery time is quick. Most people who get this procedure done return to their normal activities after a day. Minor inflammation and bruising may occur in the first few days, but they usually resolve after a week.

Does PDO thread lifting have any side effects?

If a PDO thread lifting procedure isn't done by a professional, it may result in thread protrusion and puckering of the skin. These happen when the PDO threads aren't properly implanted.

How long do the results of the PDO thread lift last?

The PDO threads dissolve after six to nine months, but their effects can last up to two years, thanks to the production of collagen.
